Project Workflow and how it works

- User what everyone sees
- ► Yolo model what happens in the back

User interface

- ► Flask:
 - Python framework for creating web applications
 - ► Generates the user interface
 - Runs the model

Algorithm

- ► Yolov5 by ultralitics Link:
 - ► Great YOLO algorithm implementation
 - Great documentation
 - ► Transfer Learning
 - Inference

Yolo Algorithm

 Used for object detection (detect objects in an image and place a box around them)

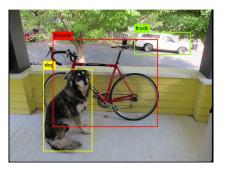

Figure 1: Prediction

Yolo Algorithm

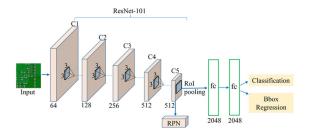

Figure 2: Detection Algorithm

Yolo Algorithm

 $\begin{array}{c} \text{14 MB}_{\text{FP16}} \\ \text{2.0 ms}_{\text{V100}} \\ \text{37.2 mAP}_{\text{COCO}} \end{array}$

Medium YOLOv5m

 $\begin{array}{c} 41~\text{MB}_{\text{FP}^{16}} \\ 2.7~\text{ms}_{\text{V}^{100}} \\ 44.5~\text{mAP}_{\text{COCO}} \end{array}$

YOLOv5I

 $\begin{array}{c} 90 \text{ MB}_{\text{FP16}} \\ 3.8 \text{ ms}_{\text{V100}} \\ 48.2 \text{ mAP}_{\text{COCO}} \end{array}$

XLarge YOLOv5x

 $\begin{array}{c} \text{168 MB}_{\text{FP16}} \\ \text{6.1 ms}_{\text{V100}} \\ \text{50.4 mAP}_{\text{coco}} \end{array}$

Figure 3: yolo_models

- 0. Get the data and in the correct format:
- dataset_folder
 - Train
 - imgS.jpg
 - ...
 - Validation
 - imgA.jpg
 - ...
 - Test
 - imgB.jpg
 - ...

0. Get the data and in the correct format:

data.yaml file

train: ./asl_dataset/train/images
val: ./asl_dataset/valid/images
test: ./asl_dataset/test/images

nc: 26
names: ['A', 'B', 'C', 'D', 'E', 'F', 'G', 'H', 'I', 'J',

1. Train the model using transfer learning

```
#!/bin/sh
python train.py \
    --batch 32 \
    --weights yolov51.pt \
    --data data.yaml \
    --epochs 100 \
    --img 320 \
    --patience 5 \
    --device 0 \
    --cache \
    --freeze 10\
    --adam \
    --hyp data/hyps/hyp.finetune.yaml \
```

- 2. Evaluate the model on the validation data
- 3. Hyper parameter optimization

4. Test the model in a real time scenario

The model is then loaded in the flask application

model = torch.hub.load("ultralytics/yolov5", "yolov5s")

Final product

```
image = self.model(frame, size=640)
names = image.names
coord = image.xyxy[0].detach().cpu().numpy()
for (x1, y1, x2, y2, conf, name) in coord:
    cv2.rectangle(
        frame.
        (int(x1), int(y1)),
        (int(x2), int(y2)),
        (255, 245, 67).
        2.)
    cv2.putText(
        frame, ...)
```
